

OCTOBER 2009 UPDATES

Tuesday, October 13, 2009 3:30 PM: Heavy rain will continue into the evening but is still forecasted to end by tomorrow. Rainfall is greater than forecasted, but local creeks are only slowly rising so far - it appears most of the rainfall is soaking into the ground. This forecast will be updated this evening if we see local creeks rising to significant levels.

Tuesday, October 13, 2009 8:00 AM: 1" to 2" of rain forecasted today, diminishing tonight. Due to dry initial conditions, flooding is unlikely today - however flood prone areas should be prepared if rainfall is higher than forecasted. In urban areas, localized flooding may occur due to clogging of the storm drain systems. If conditions change today, this forecast will be updated.
